How To Embed WPVR Virtual Tours Using Visual Composer Element

WP VR Plugin Integrations · https://rextheme.com/docs/embed-wpvr-tours-using-visual-composer-element/

If you're using Visual Composer Website Builder, you can easily embed WPVR virtual tours on your WordPress website.

WPVR has a dedicated Visual Composer element named **WP VR Visual Composer Element** that you can use to:

- Find any specific virtual tour from your saved tour list easily.
- Customize the width of your virtual tour.
- Assign a fixed height to your virtual tour.
- Set a radius to your virtual tour.

In this guide, you'll learn how to use the **WP VR Visual Composer Element** to publish a virtual tour on your website.

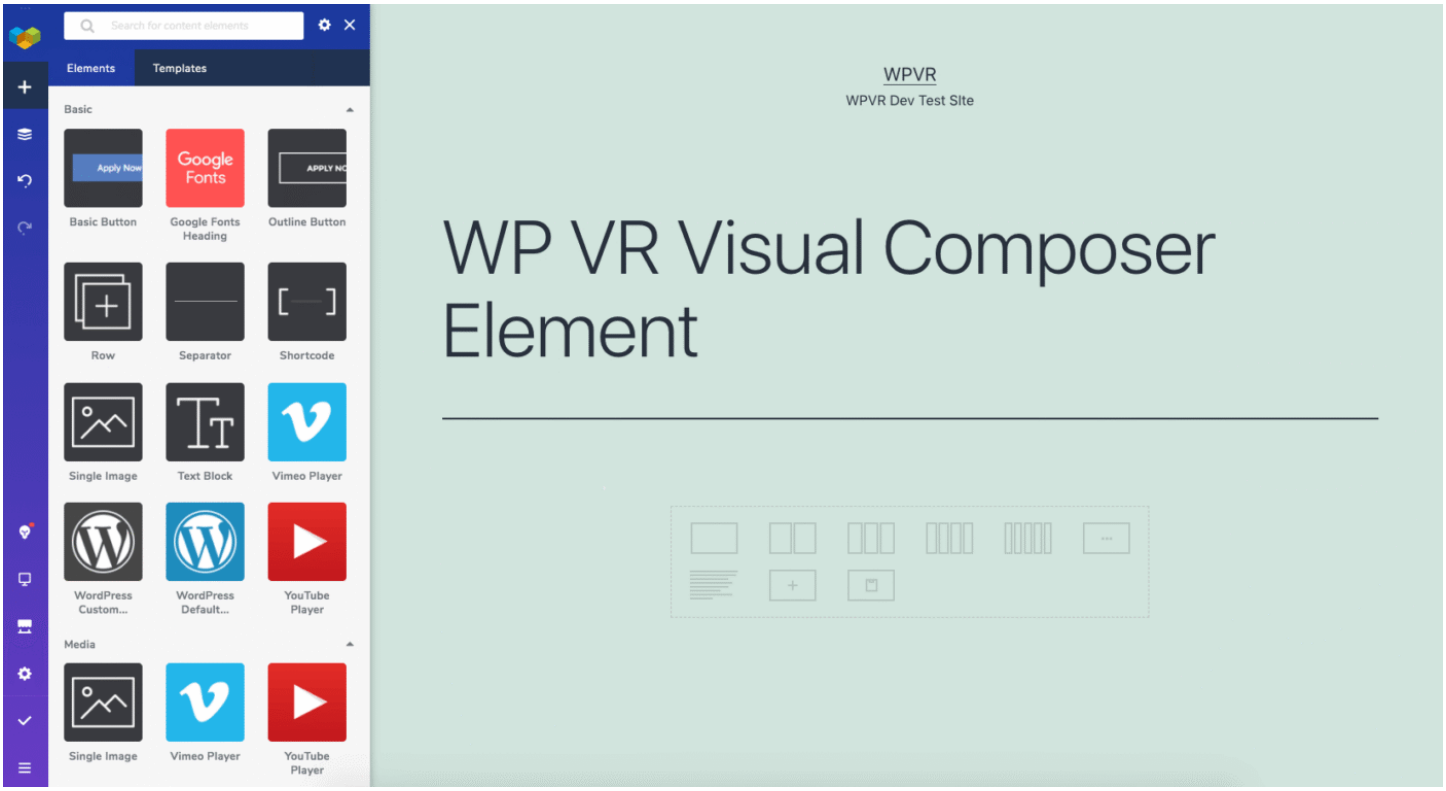
Let's get started.

Embed Virtual Tours Using Visual Composer Element

Once you have created at least one virtual tour using **WPVR**, follow the steps below:

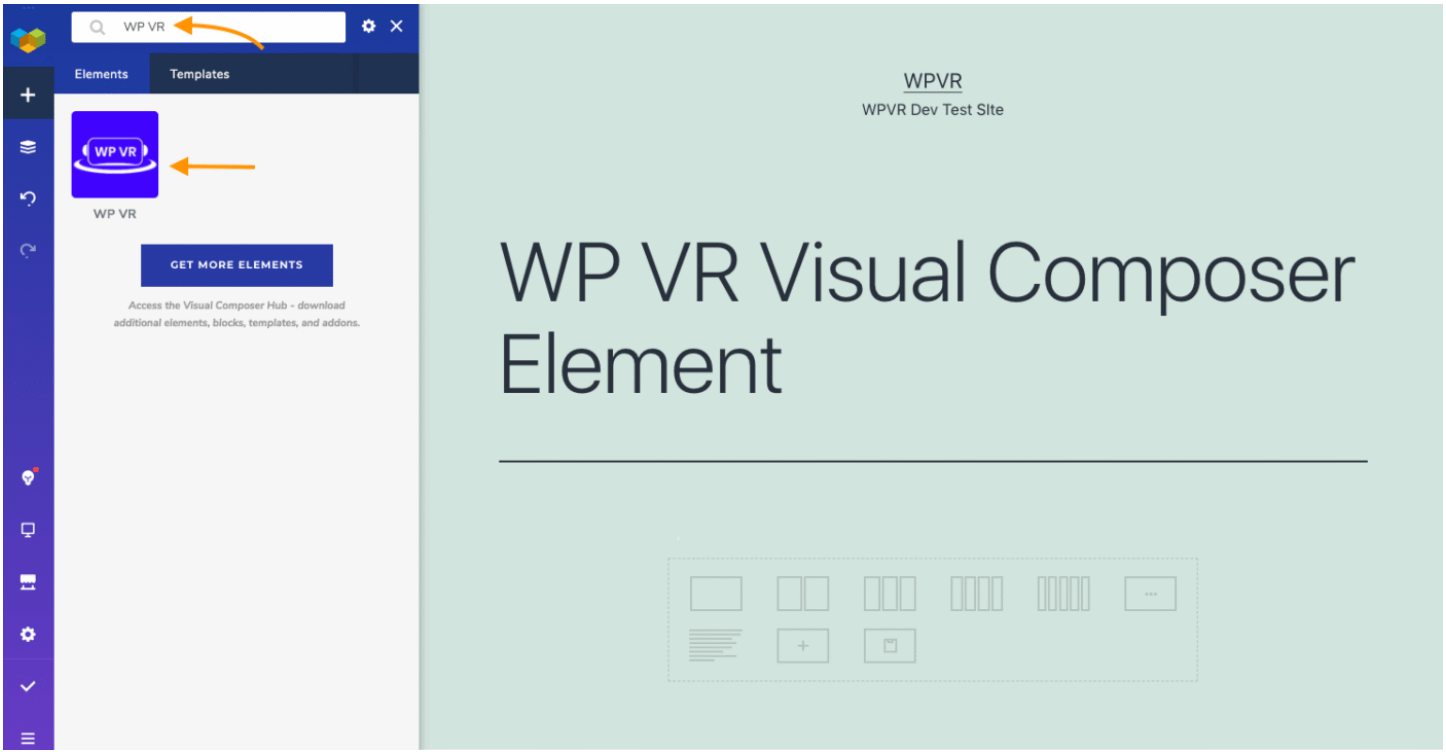
Step 1:

Choose to edit an existing page or a new page on your website using **Visual Composer**.



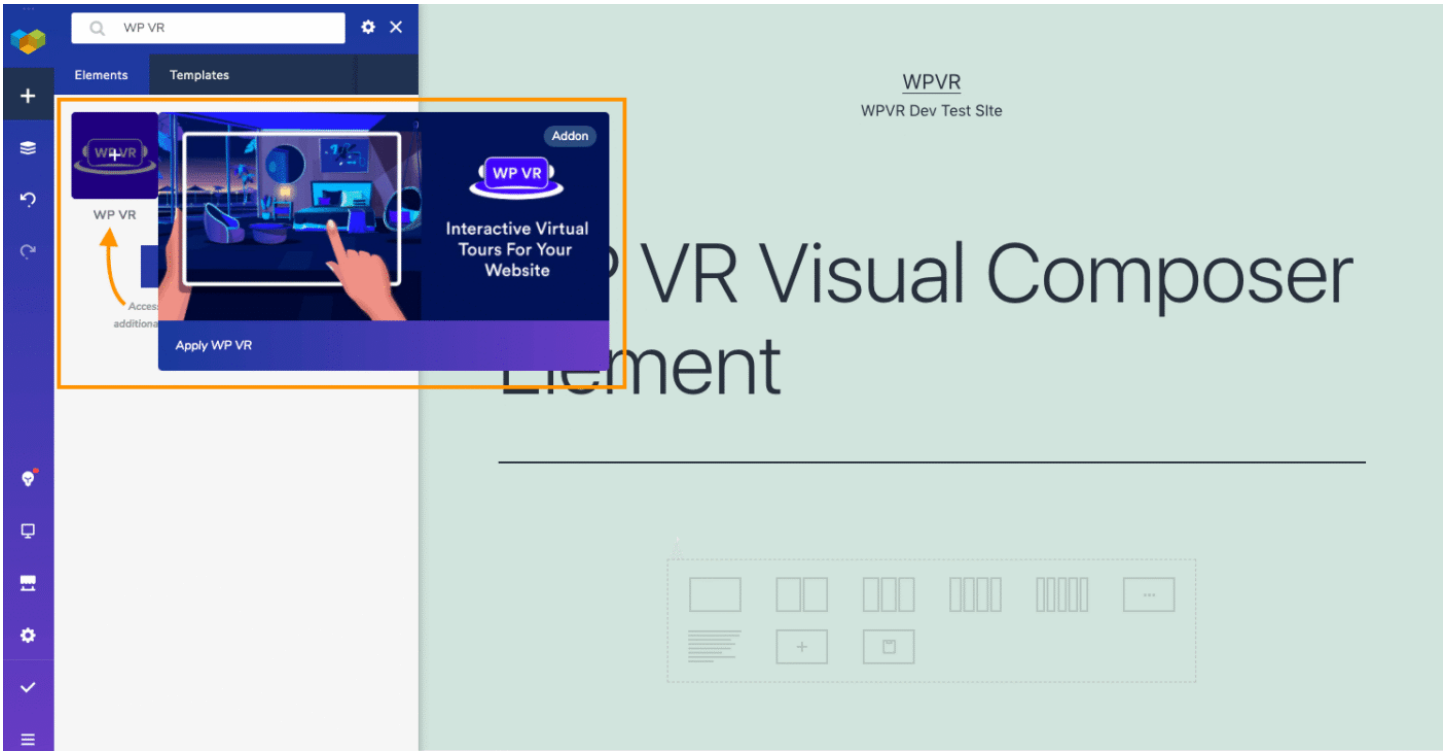
Step 2:

On the search bar for **Visual Composer Elements**, type **"WP VR"**.



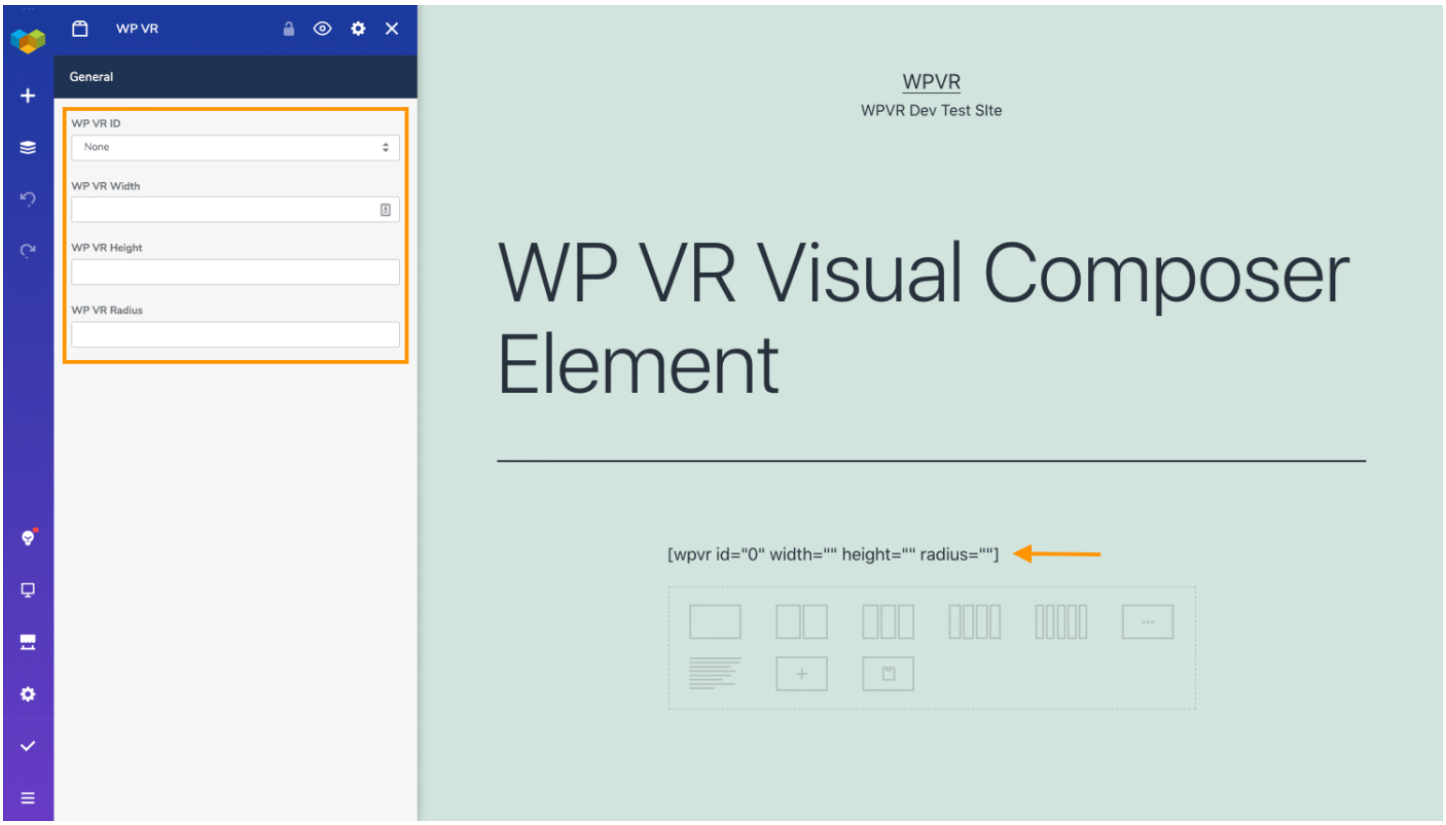
The thumbnail for the **WPVR Visual Composer Element** will appear on the result.

Now if you hover on the thumbnail, you will see the preview image of this add-on.



Step 3:

Drag the **WP VR thumbnail**, and drop it on your page where you want to publish the tour.



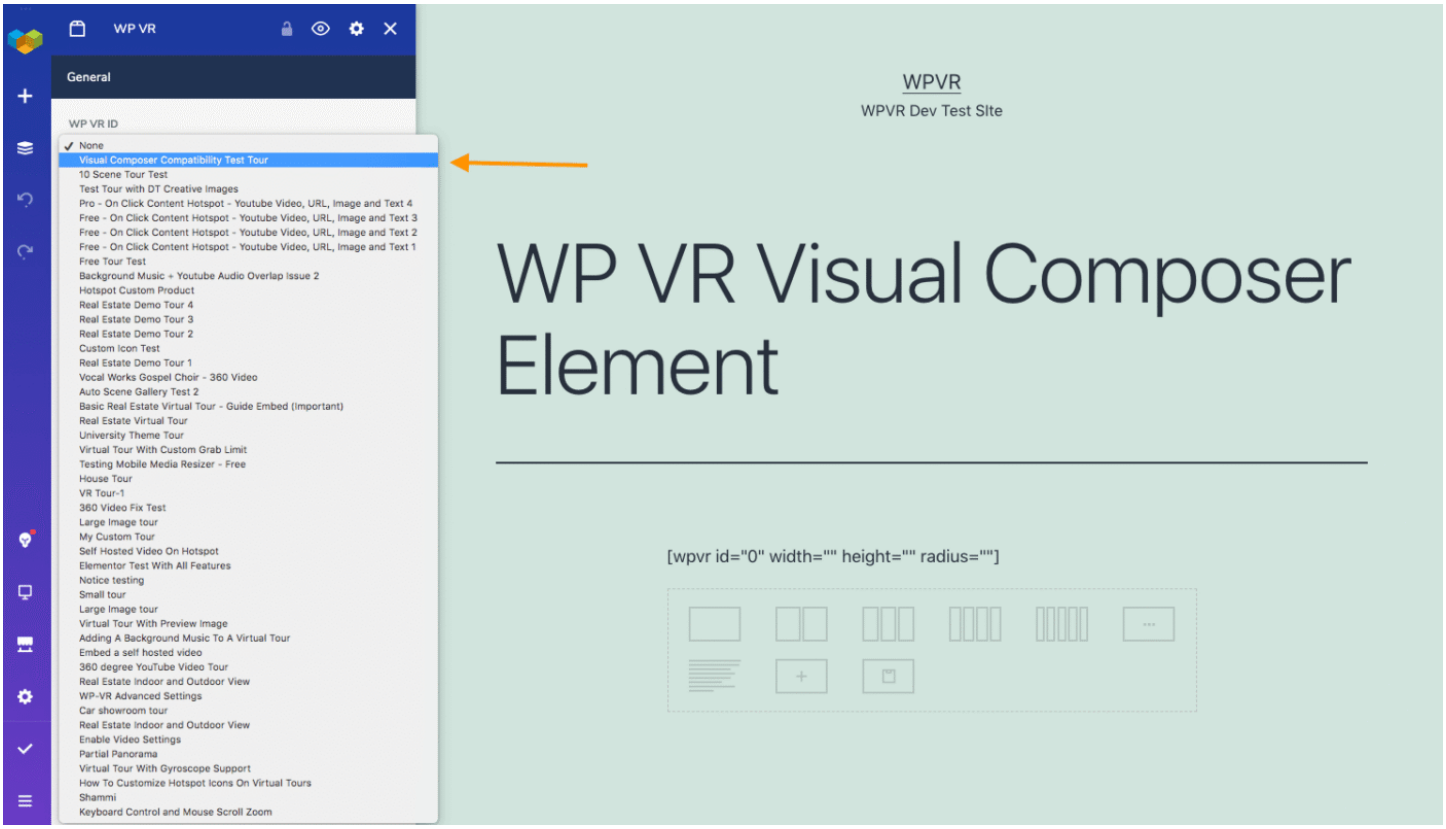
It will add the element on your page and give you the options to set your **Tour ID**, **Tour Width**, **Tour Height**, and **Radius** of the tour.

These fields will be available here:

- **WP VR ID**
- **WP VR Width**
- **WP VR Height**
- **WP VR Radius**

WP VR ID or Virtual Tour ID:

This is a drop down field and if you click on it:

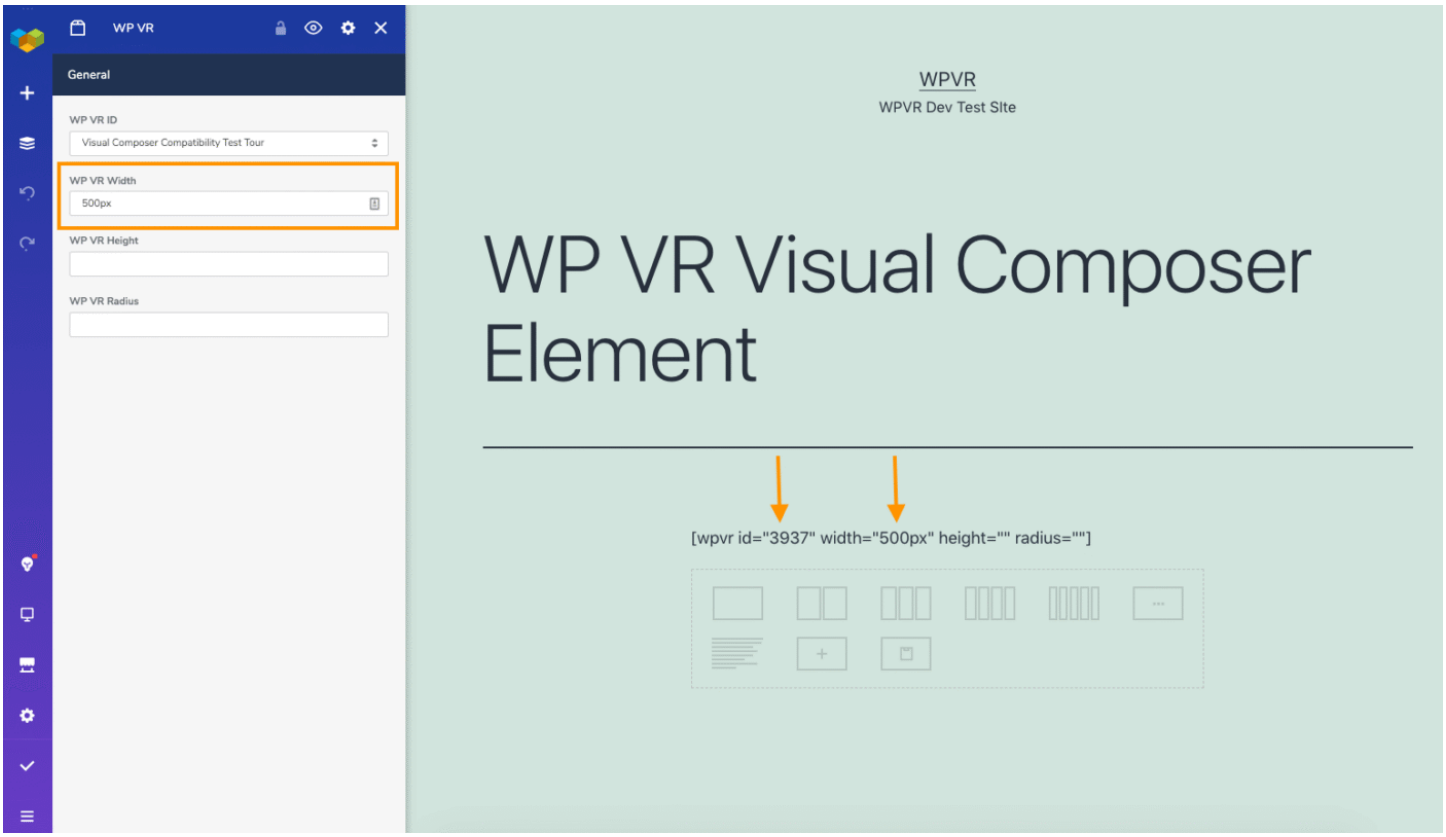


- **It will show the titles of the saved tours on your site.**
- **The titles will appear from the latest to the oldest.**

Choose your desired tour from this list.

WP VR Width:

Here, you can set a width for your virtual tour on the front-end.

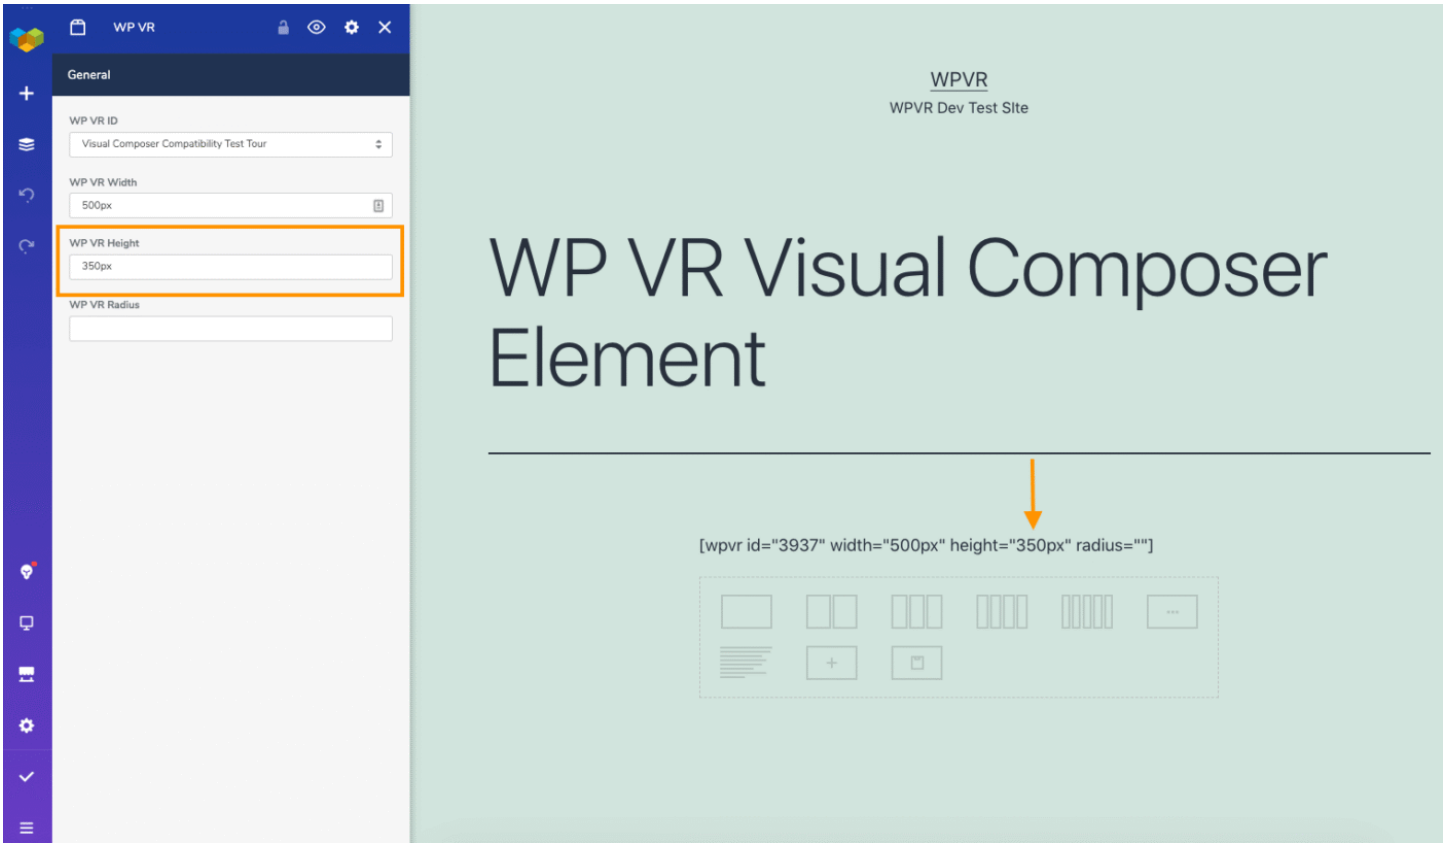


- **Assign only positive numerical pixel values here. For example, 500px.**
- **You can use the 'fullwidth' tag here, your tour will take the full width of the container.**
- **Do not set any percentage or text here.**

If you've chosen a **Tour ID**, it will appear in the element along with your width value.

WP VR Height:

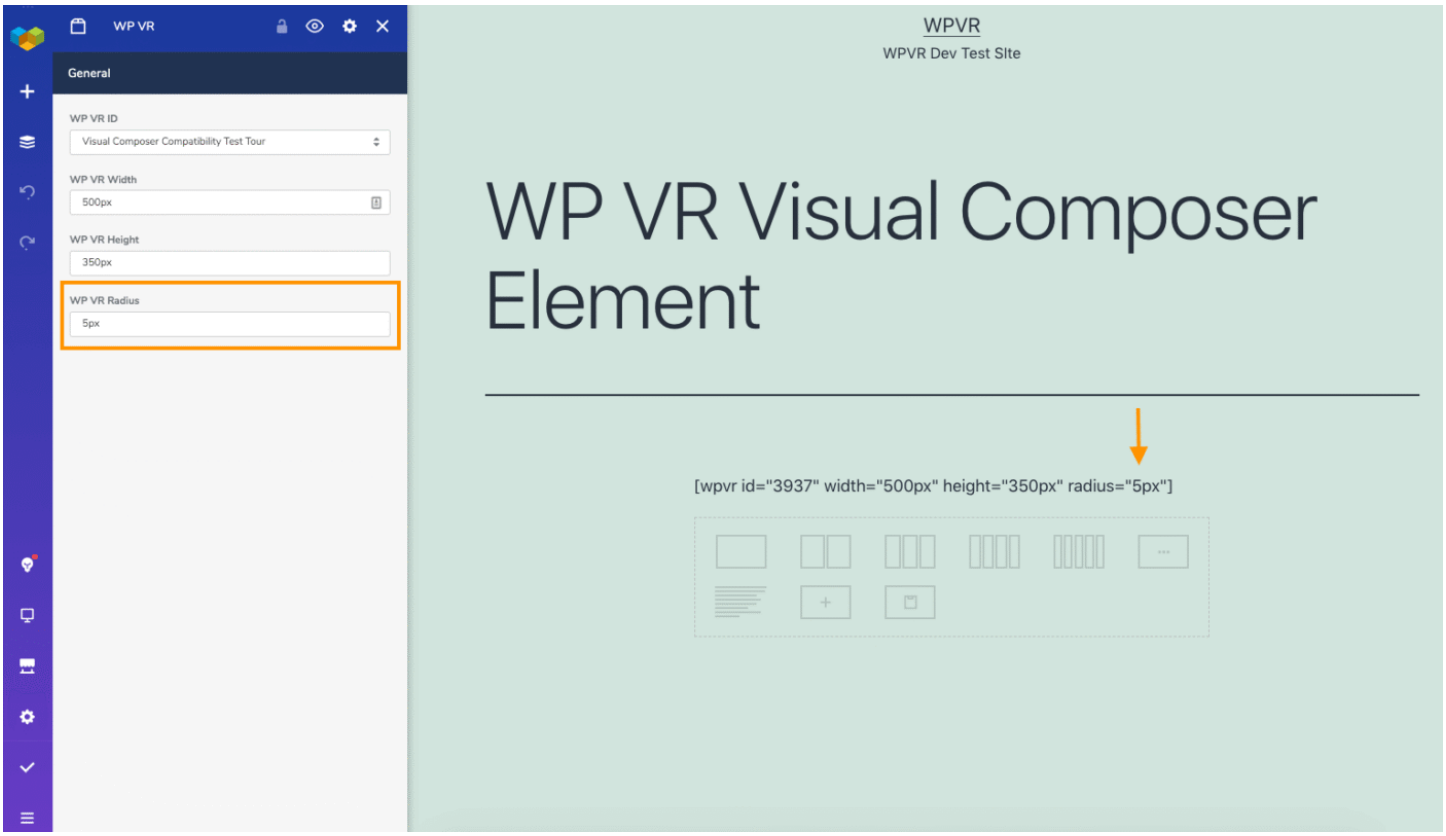
In this field, you can set a custom height value to your virtual tour for the front-end.



- **Assign positive numerical pixel values here. For example, 350px.**
- **Do not set any percentage here.**

WP VR Radius:

This field allows you to set a radius for your virtual tour.



- **Assign only positive numerical pixel values here. For example, 5px.**
- **Do not set any percentage or text here.**

***You can also keep this field empty, then no radius will be assigned to your tour.*

Step 4:

Once you've set these for your **tour**, **publish** or **update** the page. Here is how the virtual tour will look like once you've published on your page:

That's it.

As you can see, it's really easy to publish **WPVR** virtual tours on your WordPress website using **Visual Composer Website Builder**.
