How To Add Currency To Your Product Price

When you are using price attributes in your feed, most of the time you will need to add currency to your product price attribute.

Depending on your location, this currency symbol might go before or after the price, like $109.99 or 100.99 GBP.

With the Product Feed Manager for WooCommerce plugin, it's simple to do either. You can add any currency value as a prefix or suffix to your price attribute.

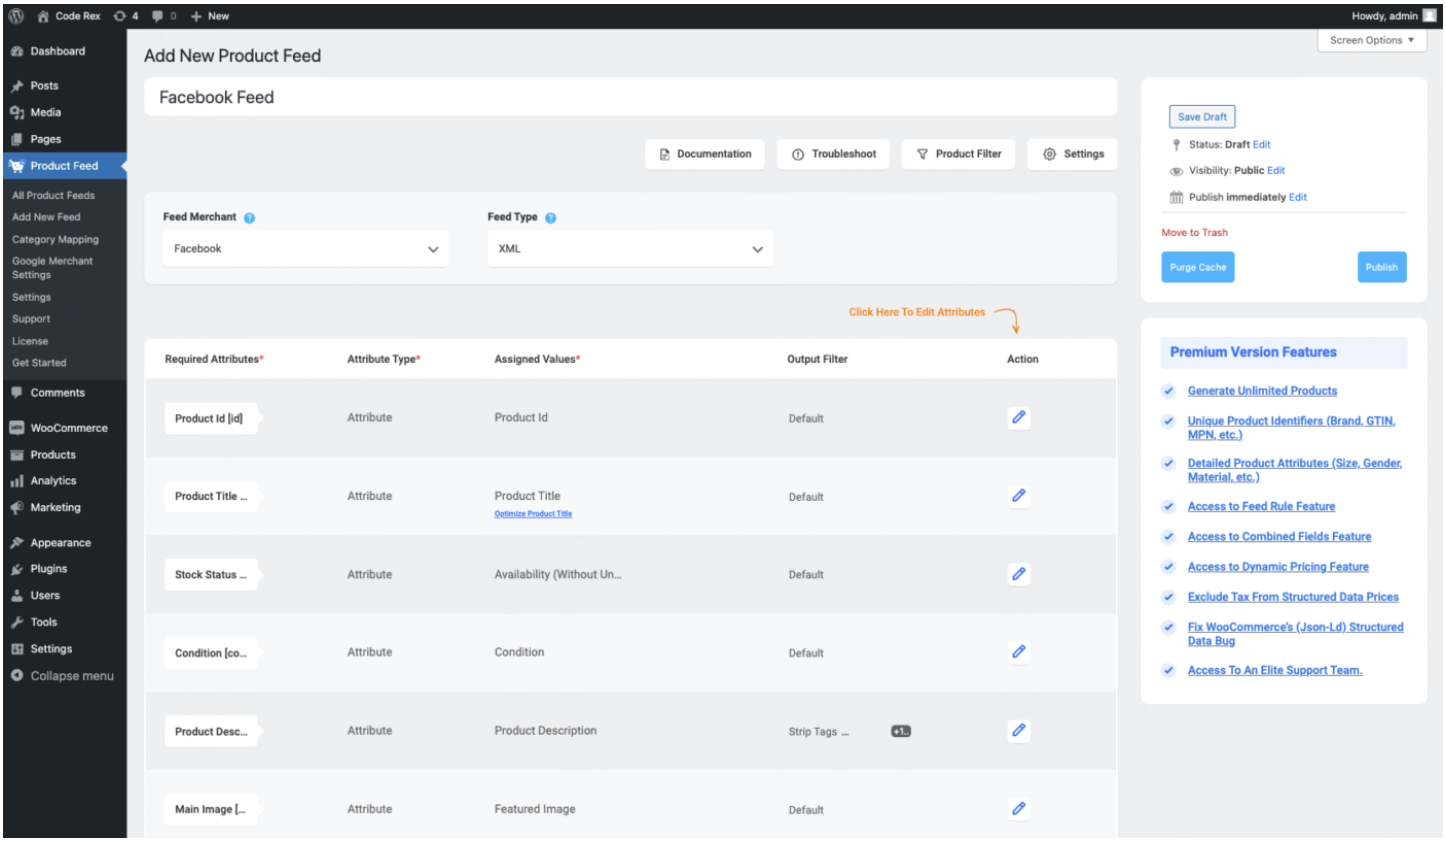
In this case, you can put any currency value as the prefix or suffix to your pricing attribute.

When you add a prefix, this static value would be placed before the attribute, such as "USD 119.99"

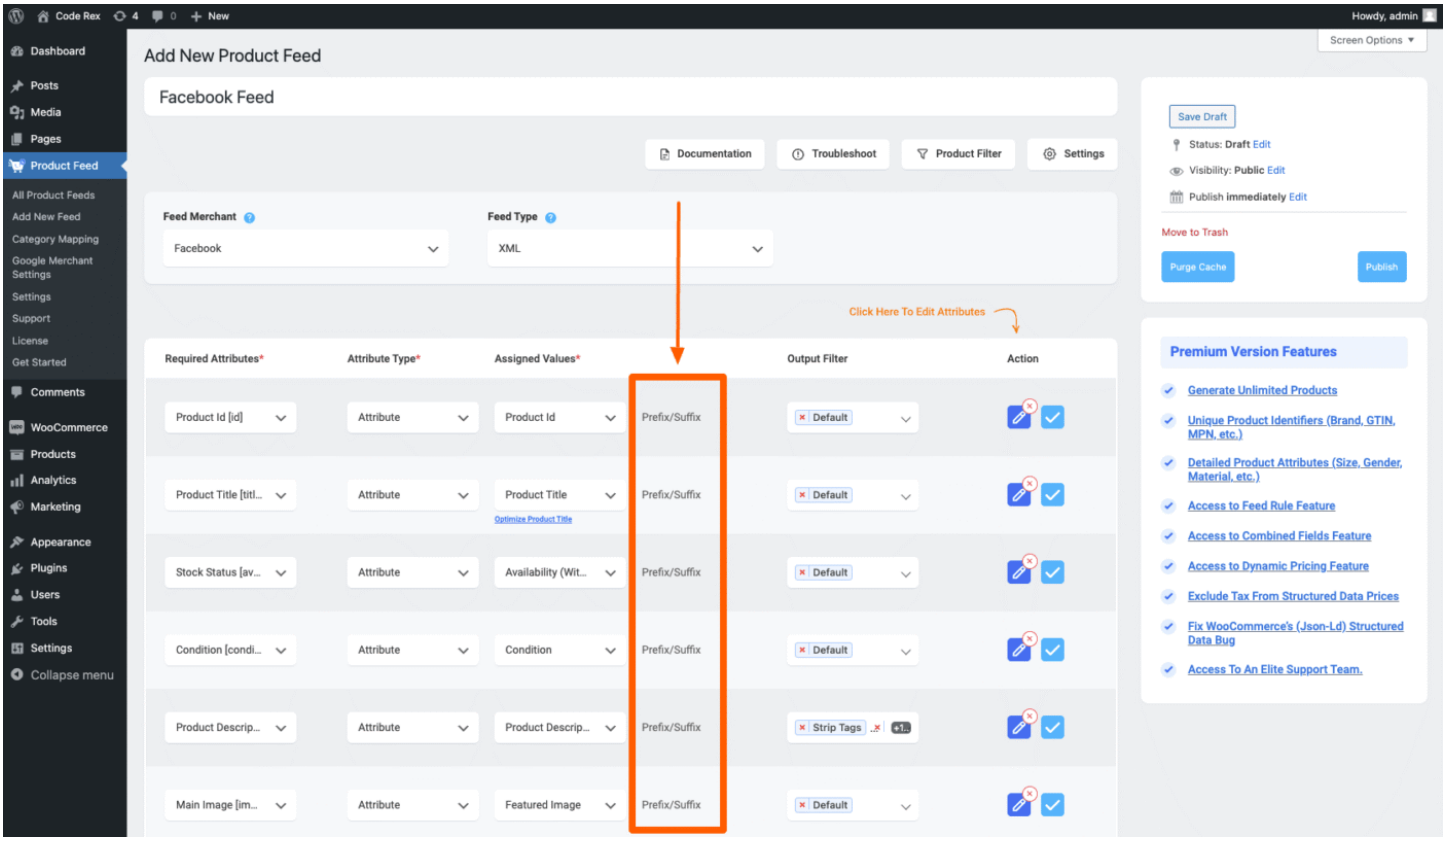
For suffixes, your static value would be placed after your attribute value, such as "119.99 USD".

In this guide, I will demonstrate how easy it is to set a prefix or suffix for any attribute.

1. At first, create a new feed and select a merchant, or open your existing feed.

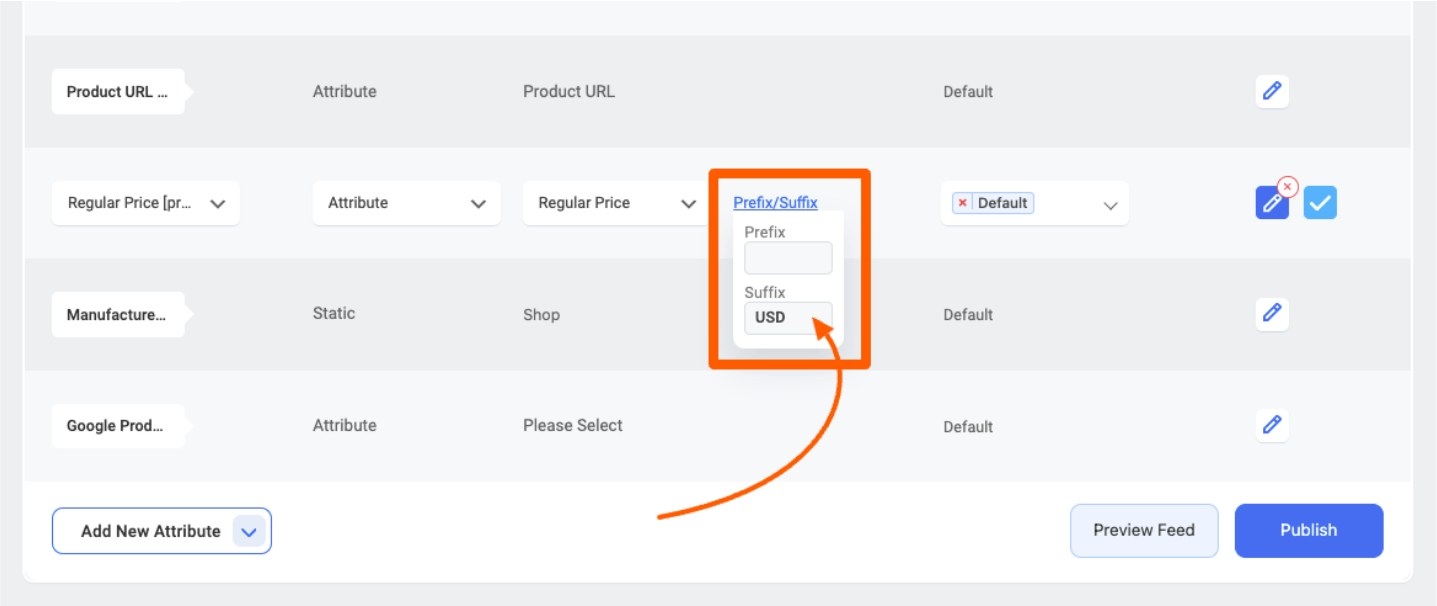


2. In the attribute section, below you will find the **Prefix** and **Suffix** options for each of the attributes.



3. Put any static value as the **Prefix** or the **Suffix** for the price attribute.

For example, below you can see that a Static value "USD" is set as the Suffix for the Regular Price attribute.



Now you can keep the suffix as it is, or you can change it to EUR or any other currency as per your required currency value.

Also, you can put the currency before the Price attribute. To do that, remove the currency value from the Suffix and insert a new value into the Prefix.

4. Complete your feed configuration and then click on the Publish or Update button to publish or update the feed.

Now, when you check your feed, you will see that your static value is added as the Prefix or Suffix to your assigned attribute.
