Demo Partial Panorama Virtual Tour – WPVR Pro

Demo Virtual Tours · https://rextheme.com/docs/partial-panorama-virtual-tour/

Embedded media: https://showcase.rextheme.com/?embed_page=237

This is a partial panorama/flat panorama virtual tour created using **WPVR Pro**.

Do you have **flat panoramic images** captured with your smartphone or regular camera and want to turn them into interactive **partial panorama virtual tours**? With **WP VR Pro** – the premium version of the best 360° panorama and virtual tour plugin for WordPress – you can easily create stunning **partial panorama virtual tours** even without full 360-degree equirectangular photos.

This powerful feature allows you to use **flat panorama images** (wide-angle photos that aren't fully spherical) to build immersive experiences. By controlling the **Vertical Angle of View** and **Horizontal Angle of View**, you define exactly how much of the image viewers can explore, preventing distortion and creating a natural, engaging tour.

Perfect for real estate interiors, landscape showcases, product displays, or any scenario where you have wide but not complete 360° shots from your cellphone.

Why Use Partial Panorama Virtual Tours in WP VR Pro?

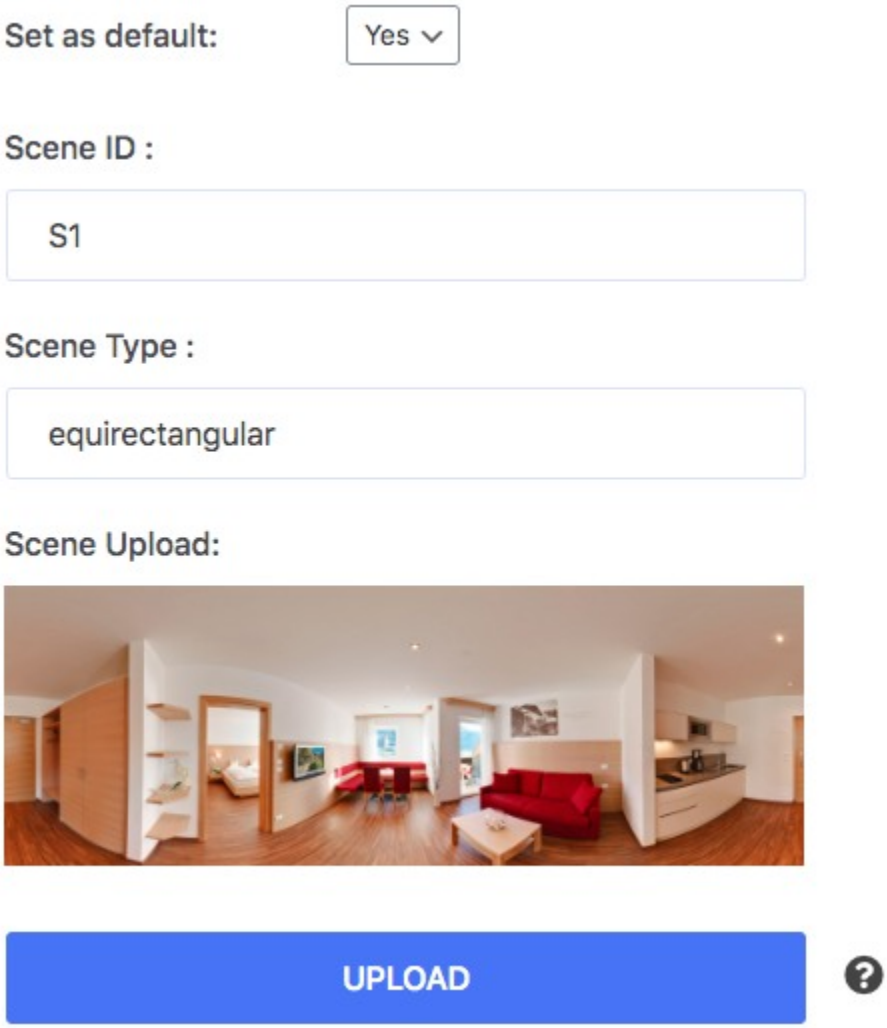

- **No Full 360 Camera Needed:** Transform ordinary **smartphone panorama photos** into interactive tours.
- **Flexible Control:** Adjust angles to fit your image perfectly – ideal for partial or flat panoramas.
- **Professional Results:** Limit viewer movement to avoid empty or distorted areas.
- **Mobile-Friendly & Responsive:** Tours work seamlessly on phones, tablets, and desktops.
- **SEO Boost:** Interactive partial panorama content increases engagement, dwell time, and user satisfaction – great for WordPress SEO.

WP VR Pro's partial panorama support makes it one of the most versatile virtual tour plugins available.

Scenes Settings: Partial Panorama Virtual Tour

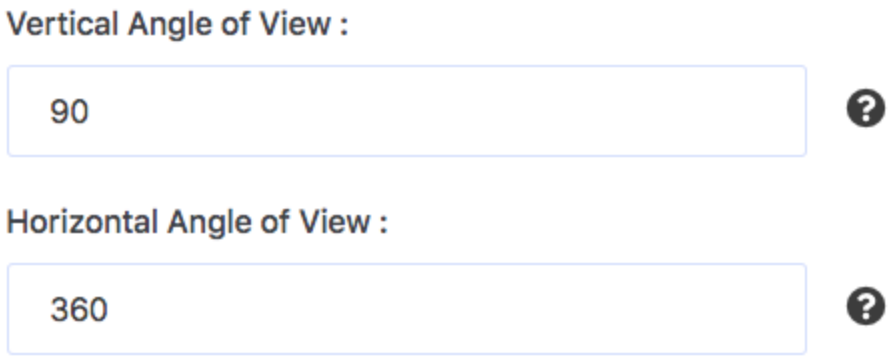

Throughout the tour, we used several scene features such as:

Set as Default: Set the current scene as the default scene.

Scene Upload: Upload the flat panoramic image.

Scene ID: You can give a unique ID to a scene or our system will auto-generate it for you.

Vertical Angle of View: This controls how much of your image will be visible on tour vertically.

Horizontal Angle of View: This controls how much of your image will be visible on tour horizontally.

Limit Vertical Scene Grab: This limits how much a viewer can see on your tour vertically.

Max Pitch & Min Pitch: We've set these two from -45 to 45 as we're using a flat panorama.

Follow this documentation to create a partial panorama virtual tour easily with flat panorama images captured with your smartphone.
