How to Create and Manage Custom Buttons and Labels

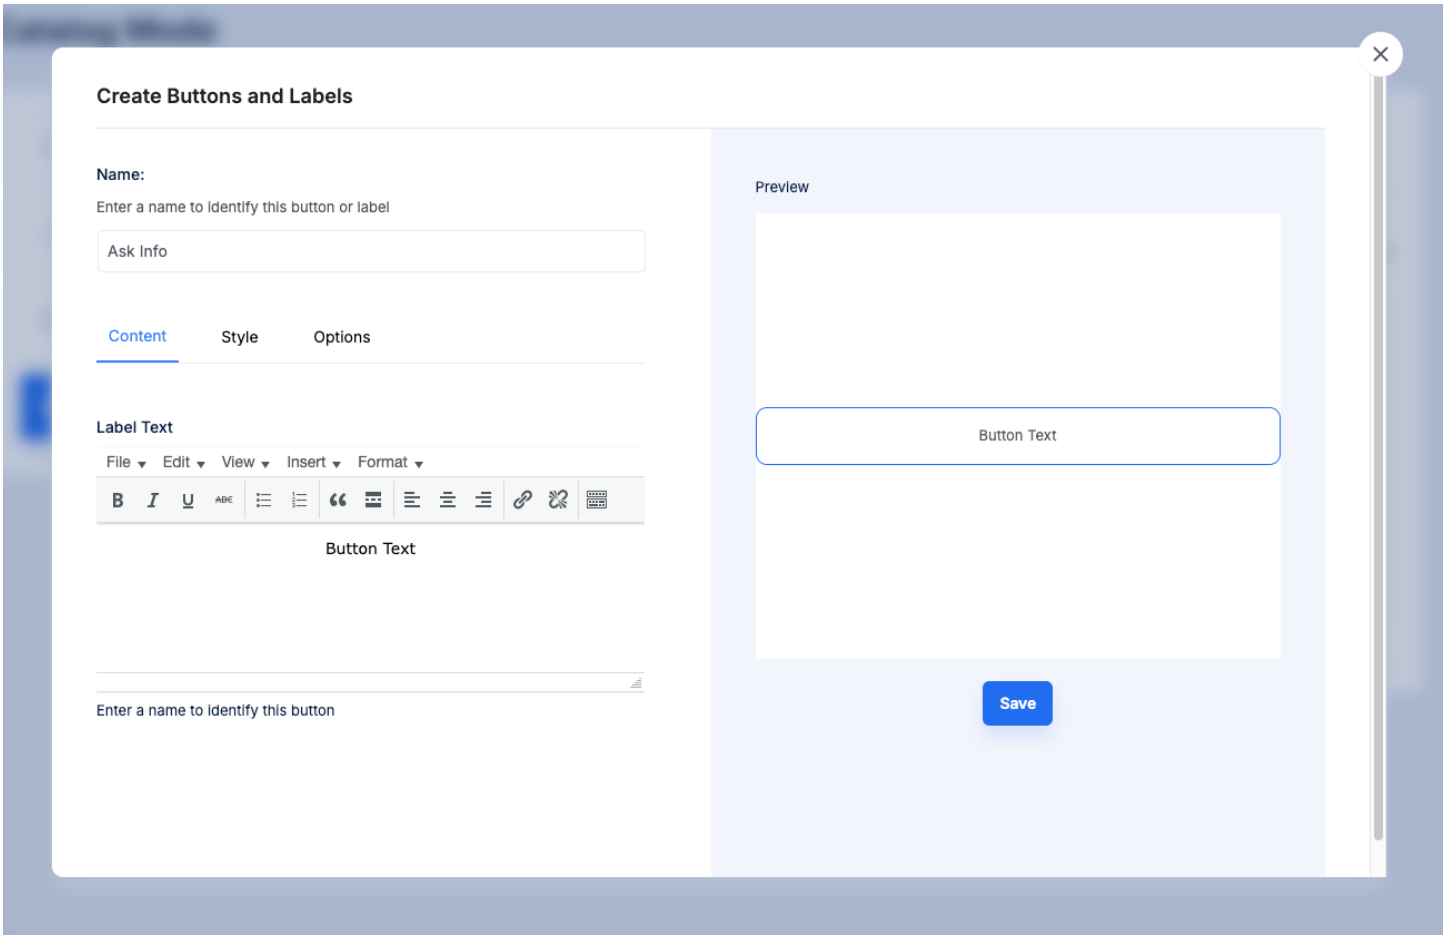

Settings · https://rextheme.com/docs/how-to-create-and-manage-custom-buttons-and-labels/

The Buttons and Labels feature lets you add custom buttons or labels to your store. You can control what text appears, whether it links to a product page or custom URL, or stays as a static label. This guide will help you create and manage buttons and labels easily.

1. Go to WordPress Dashboard > Catalog Mode > Settings > Buttons and Labels > Click on "+ Create a new button or label"

2. Once you Click on **"+ Create a new button or label"**, there will be a popup for creating and configuring the button or label

General Settings

Name:

Enter a name to identify your custom button or label. This name is for your reference and helps you manage multiple buttons or labels in your store.

1. Content

Label Text

Enter the text that will appear on the button or label. This is what customers will see on your product pages or shop pages.

2. Style

Choose how your custom button or label will look on the page. This allows you to match your store’s design and make the button or label visually appealing. You can customize colors, font, size, and

shape to ensure it fits seamlessly with your product pages or shop layout.

3. Options

Choose what happens when someone clicks this button or label. If set as a static label, nothing will happen when clicked. If linked, clicking the button will take the user to a product page or a custom URL.

- **Unlinked Text Label** – the button or label will show text only.
- **Product Page** – the button will link to a specific product page.
- **Custom URL** – the button will link to any URL you choose.

Once you have set the name, text, style and link options for your custom button or label, it will appear on your store exactly as configured. This allows you to highlight products, guide users, or replace default elements efficiently. That’s how easy it is!
